

QUTVIEW

Sovereign food-import corridor risk intelligence for the UAE

Watching the risk that price monitors can't see.

Yonatan Getinet Alemayehu

Founder · Hub71 Access Programme, Cohort 20

The UAE measures food security by price. Price isn't the risk.

The UAE imports 85–90% of its food, and its national strategy aims to rank **#1 in the world for food security by 2051**. Yet resilience is tracked almost entirely by price and reserves — not by **corridor risk**: how dangerously concentrated each import corridor is, and which supplier a commodity can't survive losing.

Dairy — the #1 food import

~\$1B/yr, and no corridor-risk visibility at all. It happens to be safe — but nobody could prove it.

“Local” food isn't self-sufficient

After the 2006 fodder-cultivation ban, 90%+ of animal feed is imported. Local poultry, dairy & meat run on it.

Single-source traps sit unflagged

Lentils are 82% dependent on one origin (Canada) — on top of being 100% imported.

The institutions responsible for sovereign food security — Silal chief among them — manage price and quantity in separate silos, with **no upstream view of which corridors are fragile, why one moved, or who else could supply it if one failed**.

THE SOLUTION

QUTVIEW scores the structure of every food corridor — and warns early.

It turns public, authoritative trade data — UN Comtrade, World Bank, FAOSTAT — into a live per-corridor risk system across **13 strategic commodities**. For each corridor, automatically:

Senses

concentration + volatility risk

Forecasts

6-month price, honest error

Alerts

when a threshold trips

Explains

what moved, arithmetically

Recommends

a reviewable action

Names alternatives

real diversification origins

Plus an AI-written intelligence brief per corridor — **every number machine-verified against the database before it displays** — and a logged human Approve / Revise sign-off. It recommends; a person decides.

One system, three surfaces — with a human in the loop.

1

Live risk dashboard

Risk cards, origin breakdowns, forecasts, the feed-dependency lens, and active alerts.

2

Power BI report

The same data at executive altitude, with plain-language guidance on every page.

3

Grounded AI brief

An analyst-quality written brief per corridor; no number reaches the page unverified.

4

Logged sign-off

Approve / Request-revision, recorded and tied to the data version — decision support, made real.

Live dashboard

Live dashboard, snapshot August 2026 — every provisional figure labelled

Insights nobody else surfaces — every figure from real data.

Big ≠ fragile

Dairy is the largest food import (~\$1B/yr) yet low-risk — well diversified (New Zealand ~40% across ~60 origins). QUTVIEW tells big from fragile, so its red flags are trusted.

The feed-dependency lens

The UAE's “local” poultry, dairy and meat secretly run on three imported feed corridors (maize, soybean meal, barley). No other dashboard shows this cross-silo exposure.

It caught its own false story

An apparent “Brazil surge” in poultry was reporting lag — Brazil's value was flat; unreported suppliers shrank the base. The tool corrected a narrative we believed.

Institutional SaaS for sovereign buyers.

Model

Annual subscription licenses to sovereign food-security institutions — high-value, low-volume, recurring.

Anchor

Silal, Abu Dhabi's food-security operator, as first target; pipeline to ADAFSA and the Ministry of Food Security.

Scale

Every GCC state shares the same 80–90% import dependency — the same engine serves six sovereign markets, plus adjacent MENA beyond.

Second line

Once proven, license the corridor-risk data / API to commercial food importers and traders.

Stage: pre-revenue. Product built and live. Immediate goal — convert the Silal thesis into a paid anchor pilot.

Six sovereign markets, one structural exposure.

Every GCC state imports **80–90% of its food** and holds a national food-security mandate with a dedicated budget. QUTVIEW sells into a defined set of sovereign buyers — not a mass market — each a high-value recurring institutional contract, expandable to commercial importers as a second tier.

6

sovereign GCC markets

80–90%

food import dependency

2051

UAE strategy: rank #1 for food security

Tailwind: food security became a permanent national-security priority across the Gulf after the 2020–2022 supply shocks.

Adjacent players — but nobody owns corridor risk.

Generic BI tools

Power BI, Tableau — visualise data, no risk model.

Commodity-price data

Mintec, S&P, Gro — sell price, not corridor structure.

Consultancies

Expensive one-off reports, not a live tool.

Spreadsheets

How most governments track it today.

Our wedge

- **Scores corridor structure**
concentration, dependency, single-source — not price.
- **The feed-dependency cross-silo lens**
reveals “local” food's hidden import reliance.
- **Honest by design**
mirror reconstruction, coverage gate, grounding check, reporting-lag guard — credibility enforced in code.

Silal is a complement, not a competitor — it monitors prices; QUTVIEW is the corridor-risk layer above it.

TRACTION

A live product, built solo.

13

commodities, 7 essential categories

3

surfaces: dashboard, Power BI, AI brief

100%

public, authoritative data sources

Built end-to-end by the founder — the entire data pipeline, risk model, forecasting, BI report and grounded AI layer. The system already senses, forecasts, alerts, explains, recommends, drafts, and captures a logged human decision.

Funds raised: bootstrapped — no external capital raised to date. Seeking the Hub71 pre-seed SAFE. *Stage: pre-revenue, pre-pilot.*

Founder-market fit.

Yonatan Getinet Alemayehu

Founder · Management Information Systems, Minnesota State University, Mankato

Built the entire QUTVIEW platform single-handedly. Track record of shipping real data systems: a live **Power BI reporting solution for Ethiopian coffee-trade data**; a salary-and-performance system in a competitive project judged by Federated Insurance's CFO; and enterprise systems (ERP, management platforms) in development.

MIS foundation

Bridges the technical build and the institutional, government-facing business the product serves.

Ethiopian heritage

Personally connected to the Horn of Africa region (Ethiopia, Kenya) a real supply origin in QUTVIEW's data and hands-on with Ethiopian commodity trade data.

Committed to relocate — and to build here.

1

Relocate

One founder committed to relocating long-term and building the team out of Abu Dhabi.

2

Land the anchor

Use Hub71's ecosystem to reach Silal & ADAFSA for a first paid pilot.

3

Build the team

Hire a small technical + commercial founding team in country.

The ask: Hub71 Access — the incentive package and, above all, the ecosystem access to reach the sovereign buyers QUTVIEW is built for. Purpose-built for the National Food Security Strategy 2051.
